for Medical Devices

Fraser AG et al; Eur Heart J Qual Care Clin Outcomes. 2022; 8: 249–258

Recommendations on methodologies for clinical evaluation of high-risk medical devices

CORE-MD

Coordinating Research and Evidence
for Medical Devices

Petra-Schnell Inderst et al, UMIT Tirol

- ❖ From the perspective of the European regulatory system under the MDR, there is too little substantive guidance on evidence standards for the design of confirmatory clinical studies for high-risk medical devices.

Implications of these systematic reviews

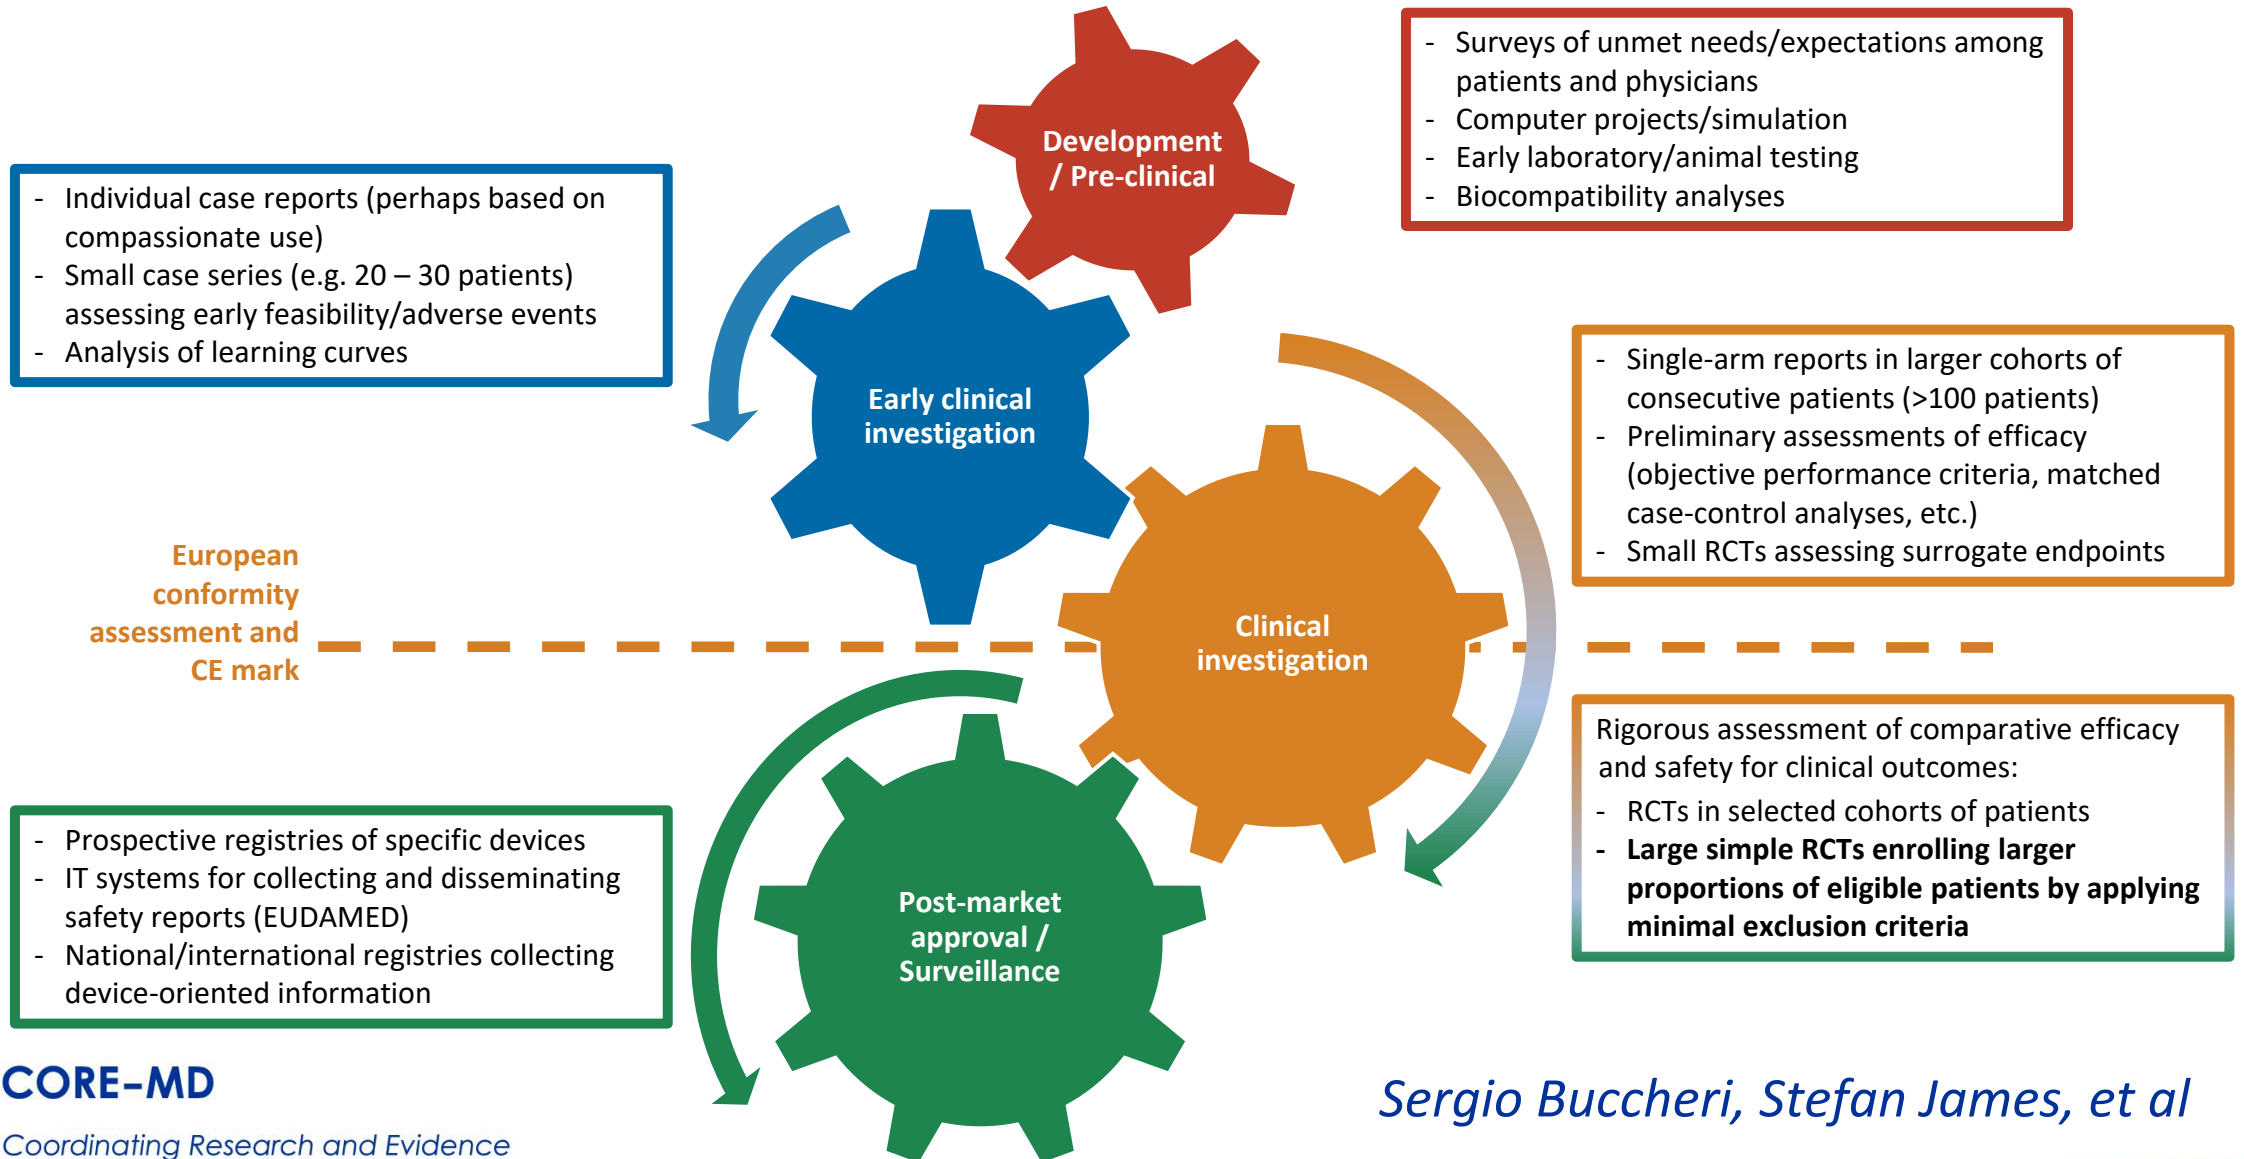

- ❖ The evidence that is publicly available from clinical investigations of high-risk medical devices before their regulatory approval and CE-marking is insufficient to enable physicians to make informed recommendations to patients of which device to use.
- ❖ Clinical trial evidence should be published when new devices are approved.
- ❖ More systematic and efficient methods are needed to evaluate the long-term safety and performance of high-risk medical devices.

Methods for evaluation and clinical investigation of devices throughout their life-cycle

CORE-MD

Coordinating Research and Evidence
for Medical Devices

Sergio Buccheri, Stefan James, et al

Example 1: Recommendations for clinical investigations of an **innovative or orphan medical device**

	Initial clinical studies	Early clinical studies	Rigorous clinical evaluation	Longterm clinical evaluation
Preferred designs	<ul style="list-style-type: none"> • Case report(s) of first implants. • Planned case series with prospective documentation. 	<ul style="list-style-type: none"> • Prospective observational study (e.g. single-arm with consecutive patients). 	<ul style="list-style-type: none"> • RCT versus current 'state of the art', with blinded determination of clinical end-points. 	<ul style="list-style-type: none"> • Mandatory registry.

Example 2: Recommendations for clinical investigations of a **new medical device in an established class**

	Initial clinical studies	Early clinical studies	Rigorous clinical evaluation	Longterm clinical evaluation
Preferred designs	<ul style="list-style-type: none"> • Case report(s) of first implants. • Prospective case series. 	<ul style="list-style-type: none"> • RCT with surrogate end-point. • Observational study with objective performance criteria. 	<ul style="list-style-type: none"> • RCT against active comparator. • RCT powered for non-inferiority. 	<ul style="list-style-type: none"> • Prospective registry with complete recruitment, recording primary end-points and adverse events.

RECOVERY
Randomised Evaluation of COVID-19 Therapy

Automated surveillance of post-market device reports (safety notices)

- Full application of Unique Device Identification, using common nomenclature
- Including standard data fields for clinically important details
- Complementary to data from medical device registries with comprehensive coverage

Ren Y et al, Ther Innov Reg Science. 2023; 57: 589–602

Training, education, and capacity building – Roadmap with educational objectives

Principal educational needs / skills

Notified body reviewers (n = 37)

- assessment of benefit-risk ratio and thresholds for acceptability
- design and development of medical devices
- methods for evaluating specific high-risk medical devices

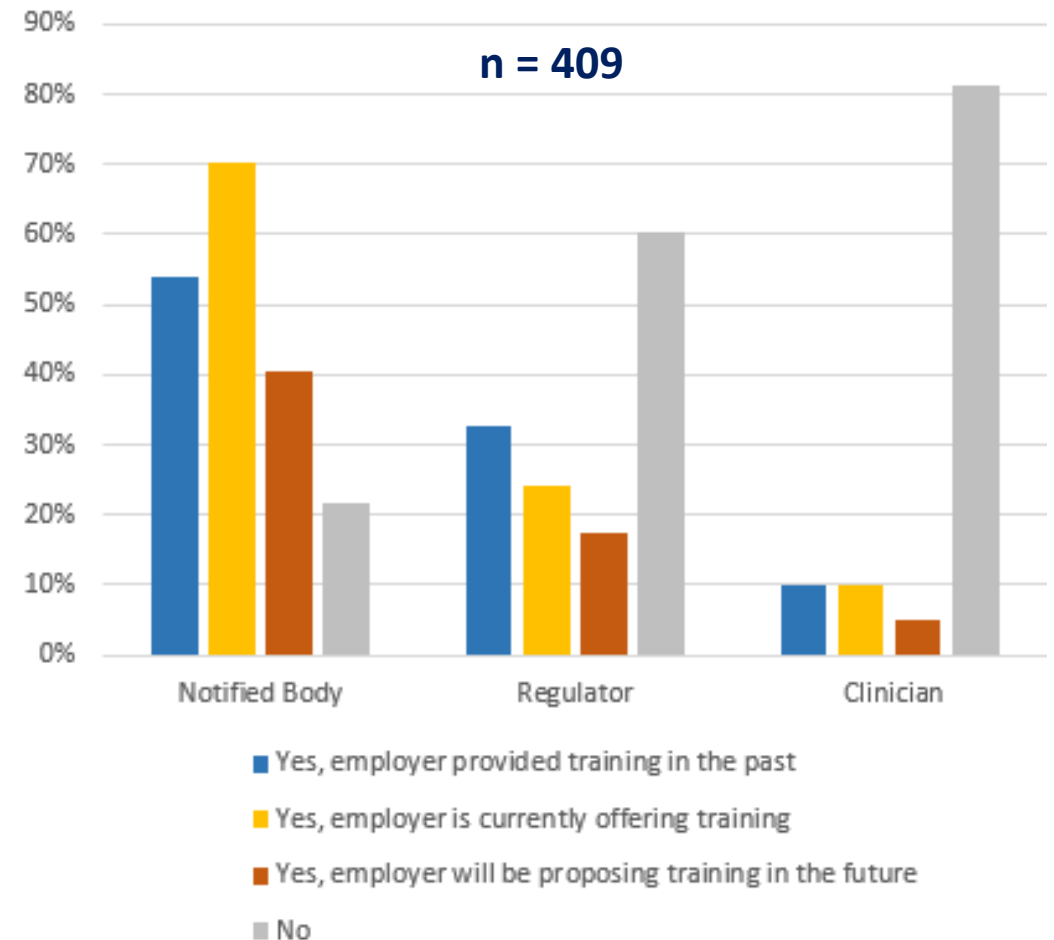

Regulators (n = 58)

- assessment of benefit-risk ratio and thresholds for acceptability
- pre-clinical testing (methodology and evaluation)
- design and development of medical devices

Clinicians (n = 278)

- study-designs and their advantages/disadvantages
- assessment of benefit-risk ratio and thresholds for acceptability
- choice of comparators (standard of care vs. sham vs. placebo)

Training opportunities with current employer

AIHTA, BioMed Alliance, and TEAM-NB

Recommendations for patient involvement

1. **Develop a set of core indicators for PROMs** per disease area that addresses patients' concerns and capture information that is relevant from their perspective, to inform healthcare decisions and further research needs.
2. **Develop ways to integrate PROMs** and patient experience data in the regulatory process for medical devices and assessment of the risk-benefit.
3. **Involve patients throughout the lifecycle of medical devices** including in the development of information/communication materials.

Generic outcome domains	N
Treatment satisfaction	34
Sleep quality	11
General QoL	5
Coping	4
Emotional distress	3
Cognitive function	1
Depression	1

Diabetes specific outcome domains	N
Diabetes-specific QoL	11
Diabetes-specific distress	17
Fear of hypoglycaemia	25
Hypoglycaemia awareness	12
Hyperglycaemia Fear	1

University of Göteborg, and European Patients Forum

EU Horizon 965246

Preparation of final recommendations

- A risk score to guide requirements for the clinical evaluation of AI devices
- A hierarchy of recommended methodologies for the clinical evaluation of high-risk devices
- Principles of ‘large simple trials’
- A charter for ethical innovation
- A framework for using real-world evidence for post-market surveillance and clinical follow-up

CORE-MD

*Coordinating Research and Evidence
for Medical Devices*

'Regulatory science' for medical devices in the European Union

- Regulatory standards informed by high-quality scientific and clinical research
- Regulatory policies and practices that are evidence-based, and proportionate
- Need for more scientific and clinical expertise within DG SANTE
- Differences in EU governance between drugs and devices are illogical
- Full transparency of clinical evidence for devices, and decisions, is essential
- More efficient (and cost-effective) clinical trials and secondary research
- Development of special regulatory pathways (orphan devices, innovation ..)
- Engagement of the medical community with other stakeholders
